

Lab Exercise 4- Signed Commits in Git and GitHub

Name – Pratik Agrawal

Sap ID – 500123601

Batch – Devops B2

Objective:

To configure Git to sign commits with GPG, push them to GitHub, and verify commit authenticity for secure code contribution.

Prerequisites:

- Git installed on your system
 - GPG (GNU Privacy Guard) installed and configured
 - GitHub account with a repository (you own or have write access to)
 - Basic knowledge of Git commands
-

Step 1 – Generate or Use an Existing GPG Key

1. Check for existing keys

```
gpg --list-secret-keys --keyid-format=lo
```

2. If no key exists, generate a new one

```
gpg --full-generate-key
```

- Select **RSA and RSA**
- Key size: **4096**
- Expiration: **0** (never) or a fixed date
- Enter your **GitHub-registered name and email**

3. Get your key ID

```
gpg --list-secret-keys --keyid-format=long
```

Example output:

```
sec rsa4096/3AA5C34371567BD2 2025-08-13 [SC]
```

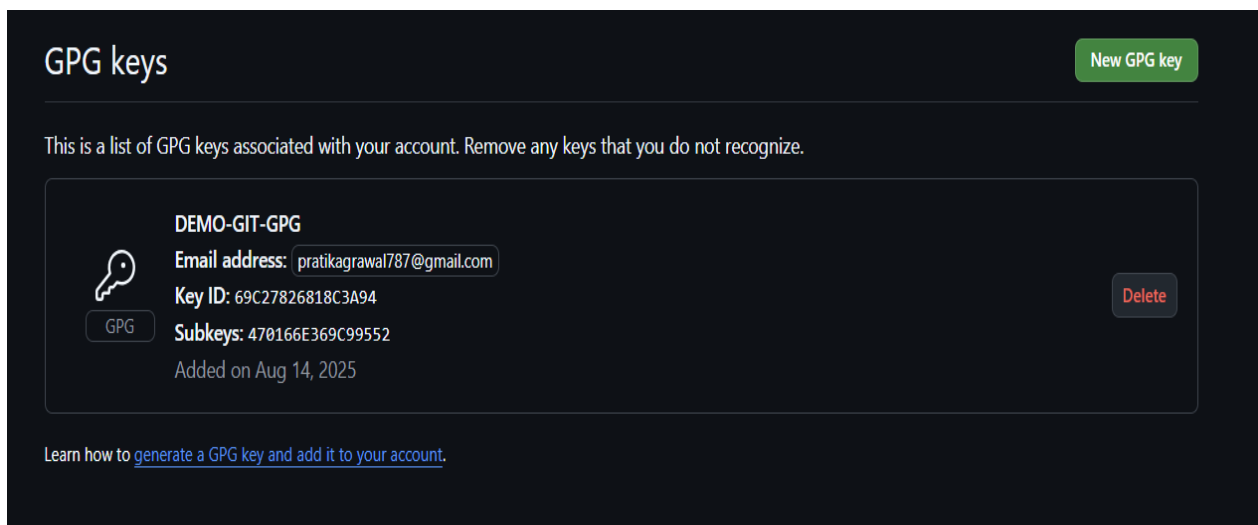

Here, 3AA5C34371567BD2 is your key ID.

Step 2 – Add GPG Key to GitHub

1. Export your public key:

```
gpg --armor --export YOUR_KEY_ID
```

2. Copy the output.
3. Go to **GitHub** → **Settings** → **SSH and GPG Keys** → **New GPG Key**.
4. Paste your key and save.

Step 3 – Configure Git for Signed Commits

1. Tell Git which key to use:

```
git config --global user.signingkey YOUR_KEY_ID
```

2. Enable signing for all commits:

```
git config --global commit.gpgsign true
```

Step 4 – Make a Signed Commit

1. Clone your repo (or use an existing one):

```
git clone https://github.com/<username>/<repository>.git  
  
cd <repository>
```

2. Edit or create a file:

```
echo "Secure commit test" >> secure.txt  
  
git add secure.txt
```

3. Commit with signing:

```
git commit -S -m "Add secure commit test file"
```

4. Enter your GPG passphrase when prompted.
-

Step 5 – Push and Verify on GitHub

1. Push the commit:

```
git push origin main
```

2. Go to your repository on GitHub → Click the commit → You should see a **green “Verified” badge**.
-

Step 6 – Local Verification of Commit

```
git log --show-signature
```

This will display the GPG verification details locally.

Use Case

Signed commits prevent identity spoofing in collaborative projects, ensuring only verified authors can make trusted changes in critical codebases.
